As seen in the table, Wi-Fi devices with USB connectivity may not use the same drivers or support the same features as those with built-in Wi-Fi connectivity. In all the examples above, simply adding a Wi-Fi USB adapter to a Windows 7 machine does not enable the device to automatically become discoverable. For this to happen, the Windows 7 Setup utility must be used to:

Select "Wireless networking" Select "Manually connect to a network" Specify the password for the wireless network (if necessary). After the USB adapter has been connected, the Windows 7 system does a one-time discovery process to find all the wireless networks in the area and automatically connects to the one that the user is closest to. Once the Windows 7 system has connected to a network, the Windows 7 Setup utility can be used to disable wireless networking, set the SSID and security information, and change the wireless network access type. wireless networking standard Category:Wireless networking [Effect of flavonoids of Glycyrrhiza uralensis on c-fos gene expression in hippocampus in mice]. To investigate the effect of Glycyrrhiza uralensis flavonoids (GUF) on the expression of c-fos gene in hippocampus of mice with learning and memory impairment. In the experiment of spatial learning and memory of mice, the Kunming strain adult mice were selected as the experimental animals, they were randomly divided into 4 groups, the control group, the model group, the low-dose group, the high-dose group. The mice were pretreated with complex recipe of GUF, and then the spatial learning and memory of the mice was examined. The c-fos immunohistochemistry of hippocampus of mice was observed. The expression level of c-fos was significantly increased in hippocampus of mice in the model group (P<0.05). The expression of c-fos in 82157476af
